Dear George Wang -

I hope this email finds you well. :)

We would like to invite you to review the following Poster for CHI 2026, considering your expertise in intelligent agents, collaboration and decision-making research, and broader human-computer interaction. Please note that poster reviews are expected to be lighter compared to full paper reviews. We deeply appreciate your time and commitment to the conference as we look for suitable reviewers for hundreds of posters!

Reviews are due by February 11, 2026.

#5647 - Investigating Effective Uncertainty Visualizations for Ordinal Crowdsourced Data of Crowding Conditions

https://urldefense.proofpoint.com/v2/url?u=https-3A__new.precisionconference.com_chi26d_decline-5Freview_MjU5NA.ykdJ1KrpwZszsJQixfrFHj8wvM&d=DwlFaQ&c=slrrB7dE8n7gBJbeO0g-IQ&r=kass0JWVleolriXnzcWXMg&m=Me0UrKTM_MPN92n5YOlvMANDu-TkVlqdnzcO5CgxAuqv6_ZE6xW3bHaOWOwvK6h&s=eZyFpPvHDLj39CCKUU3lQIZ9qI5E-UKaVQfQ0KPggvl&e=

Please note that many Posters will be of interest to a broad audience and the lessons learned may be about methods or processes that could be applicable across a number of areas, so it may be appropriate to review a submission with a topic outside your core area of expertise. The review form asks for your degree of confidence in your assessment so you can use that, and also the comments for the committee box at the end of the form, to ensure we are aware of any concerns about your confidence in your assessment. With this being said, if the submission is not one you are comfortable reviewing please decline this request and we may provide you with an alternative submission to review.

Please decline the request if there is any conflict of interest (e.g. a submission from your institution or from close colleagues).

Thank you for considering this request,

Benjamin Cowan, Juliana Jansen Ferreira, Dakuo Wang, Marios Constantinides, Marta E. Cecchinato, Rachel McDonnell, Smit Desai, Jaisie Sin, and Bingsheng 'Arthur' Yao

#5647 - Investigating Effective Uncertainty Visualizations for Ordinal Crowdsourced Data of Crowding Conditions

Abstract

Commuters often encounter crowding in railway systems, particularly in queues where passenger density varies throughout the day. This introduces uncertainty in crowdedness, making it difficult for individuals to anticipate conditions and plan their trips effectively. Crowdsourcing has been a valuable method for collecting localized user data. But the unpredictability of crowds and the uncertainty of crowdsourced information pose new challenges for decision-making. However, we know little about how to effectively visualize uncertainty in crowdedness to support informed commuting decisions, particularly when using crowdsourced ordinal data. Here, we investigated different uncertainty visualizations and their effectiveness in representing the variability and reliability of crowdsourced crowding data. They were evaluated through an online study, and we found that cluster visualization is best suited to reduce cognitive load while maximizing user confidence and trust. On the other hand, participants showed higher accuracy in determining crowd levels when using bubble treemaps.
